

MARKETING & PRE-SALES AUDIT

Demand Quality, Revenue Reality, Pipeline Health & Action Plan

Sell.Do — Kylas CRM · Pre-Sales team (Revati Ambike, Ashwini Nirmal, Gayatri More)

Audience: Marketing & Pre-Sales teams (shared manager)

Period reviewed: June 2026 (demand quality) and Jan–Jun 2026 (revenue). Pipeline snapshot as of 6 Jul 2026.

Purpose: An evidence-based audit of the pre-sales/marketing funnel — what we generated, what actually converts, where revenue really comes from, and a prioritised plan. Every figure is traceable to a Kylas query or the per-deal dataset cited alongside it.

Status: Internal — for review and action.

0. How to read this report (scope, data & method)

So the findings can be actioned rather than debated, here is exactly how every number was produced. Anyone can reproduce them in Kylas with the filters below.

- **Who counts as Pre-Sales:** the CRM team “Pre-sales team” (Kylas report 361026 filter: Created-By Team = Pre-sales team). Members with activity in the period: Revati Ambike, Ashwini Nirmal, Gayatri More.
- **June demo universe (253):** deals with a meeting/demo actually conducted in June — cfMeetingConductedOn between 01–30 Jun 2026 (IST), created by the Pre-sales team. The CRM list view shows 241 only because its default time cut-off is 17:00 on the 1st/30th; the full calendar month is 253.
- **Revenue universe (closures):** deals in the Sell.Do Deal Pipeline (5313) that reached Won/Booked (stage 35813) with actualClosureDate in the period, created by the Pre-sales team. Revenue = cfBilledAmount; cash = cfActualPaymentReceived.
- **Open pipeline:** forecastingType = OPEN, pipeline 5313, created 2026, Pre-sales team (480 deals). The triage focuses on the 150 that are genuinely workable: demo done, 5+ licences, updated since 15 May.
- **Quality verdict (GREEN/AMBER/RED) and conversion probability:** an independent read produced for this audit by reading every deal’s structured fields AND free-text notes against a fixed rubric, then a probability model fitted on the June outcomes. This is NOT the hourly CRON’s output; it has since been wired into the deal-audit skill so the CRON now stamps the same band.
- **Coverage note:** 253/253 June demos and 150/150 open deals were fetched with full notes. For the 6-month closures, 208 of 216 were fetched cleanly (96%); totals below are on the 208 and are therefore slight under-counts, not over-counts.

Source: Kylas CRM search API (pipeline 5313), report 361026, and per-deal exports stored in master_dataset.csv, closures_dataset.csv, closures6m/, open_pipeline_focus.csv.

1. Executive summary

The engine produces plenty of activity but not enough of the *right* activity. In June, pre-sales ran 253 demos; only 98 (39%) were genuinely well-qualified, and effectively all revenue traced back to those. Real money is made by developers (80% of June revenue) and by a handful of high-intent channels (Organic, Google) — while a large share of effort goes to sub-scale channel partners, a Facebook channel that converts at 2%, and demos that were never properly qualified. The good news: the levers are specific and measurable.

The seven findings, in priority order:

1. **Quality, not volume, is the whole game.** GREEN demos convert 24.5%; AMBER 1.0%; RED 0%. 24 of 25 June wins were GREEN.
2. **We missed the quality target.** Target was 200+ demos of 5+ licences; we delivered 146. 107 demos (42%) were 1–4 seats and converted at 6.5%.
3. **Revenue is developer-driven.** Developers = 80% of June revenue (₹50.0L of ₹62.4L) and close ~2× faster than channel partners — yet we run more channel-partner demos.
4. **Marketing spend is mis-aimed.** Organic (13.7% win) and Google (9.5%, best size mix) work; Facebook is 19% of demos but 2.1% win — and the single biggest paid cluster, Meta “Lead-Gen Conversion” (~40 demos), maps to that weak Facebook source.
5. **Off-territory developers are a real, ignored market.** Over 6 months, non-rep cities produced ~₹77L (29% of revenue); ~₹50L of that was developers closing remotely (East belt: Kolkata, Ranchi, Bhubaneswar).

6. **Leads are distributed by availability, not strength.** Revati converts developers 24% (Ashwini 3.7%); Ashwini converts channel partners 11.7% (Revati 4.8%). Routing ignores this.
7. **A third of the “qualified” open book shouldn’t be there.** Of 150 workable open deals, only 32 are truly HOT/WARM; 27 need re-qualification, 24 are stalling on the rep, 23 are dead.

Headline scoreboard

Metric	Value	Read
June demos conducted	253	Activity was high
Well-qualified (GREEN)	98 (39%)	Where ~all revenue comes from
Demos of 5+ licences vs target	146 vs 200	Quality target missed
June revenue (billed / collected)	₹62.4L / ₹45.4L	42 closures
Developer share of June revenue	80%	₹50.0L of ₹62.4L
6-month revenue (208 closures)	₹2.67 Cr	Jan–Jun 2026
Off-territory revenue (6-mo)	~₹77L (29%)	Developer-led, no local rep
Onsite demos	33 of 253 (13%)	Off-model; onsite wins 15.2% vs 9.1%
Open pipeline worth working now	32 of 150 (HOT+WARM)	~₹9.8L ACV

Source: Kylas: cfMeetingConductedOn Jun 2026 (n=253); closures pipeline 5313 stage 35813 (n=42 June, 208 six-month); analytics_v2.json; closures_analytics.json.

2. Demand quality — the 253 June demos

2.1 What GREEN, AMBER and RED mean

Every demo was graded on **how well pre-sales qualified it** — not on whether Sales later closed it. A demo is scored by reading the deal's structured fields AND the free-text notes against a fixed rubric covering five things: (1) is the contact a real, named decision-maker; (2) is it a real company with a genuine CRM need; (3) is the size adequate (5+ seats); (4) is the key information captured (BANT, city, current tool); and (5) is the data clean (no junk/placeholder name or dummy phone). The verdict is the analyst's read on data quality — the picture a sales rep gets before the demo.

Verdict	What it means for a demo	Typical signals we saw
GREEN	Genuinely qualified. A real, named decision-maker at a real company, a clear CRM need, 5+ seats, and the key facts captured. Good pre-sales work — even if Sales later loses it.	Owner/MD engaged; verified company; ~5–40+ seats; budget/timeline noted. E.g. M3M (100 seats), Doff Estates (25).
AMBER	A real demo but with qualification gaps. Thin/partial BANT, small size, a junior or unconfirmed contact (not the decision-maker), or missing information. On-ICP, but the rep must confirm things before it can close.	Manager (not owner) attended; ~3–5 seats; price discussed but no budget/timeline; contact identity not fully verified.
RED	Poor pre-sales work — should not have been booked. Junk/placeholder contact, no real need, wrong ICP (a 1-seat individual or tiny broker with no intent), or a "demo for the number" with no substance.	Placeholder name ("T Rex") or dummy phone (+91 9999999999); 1–2 seats; not actually looking; enrichment resolves to a different/unrelated person.

Why this matters: the verdict grades pre-sales only, so it is fair to the team — a GREEN demo that Sales fails to close stays GREEN (the miss is downstream), and a RED demo cannot be rescued by Sales. It also turns out to be an accurate forecast: in §3, GREEN demos convert 24.5% while RED convert 0%.

Source: Audit rubric applied to all 253 deals' fields + notes (master_dataset.csv). The same rubric is now embedded in the hourly deal-audit skill.

2.2 The distribution

On the stated target — 200+ demos of 5+ user licences — we delivered 146 (58%). First, the quality split:

Pre-sales quality verdict	Demos	% of demos
GREEN — genuinely qualified	98	39%
AMBER — real but thin	98	39%
RED — poor / sub-ICP	57	22%
Total	253	100%

Source: Rubric scoring of all 253 deals' fields + notes (master_dataset.csv). GREEN/AMBER/RED defined in the audit rubric.

The licence-size split shows where the gap is — 42% of demos were sub-5-seat prospects:

Licence tier	Demos	%	Win rate	GREEN rate
Under 5 seats	107	42%	6.5%	14%
5–10 seats	116	46%	12.1%	54%
10+ seats	30	12%	13.3%	67%

Source: cfiMeetingConductedOn Jun 2026; noOfLicenses; is_won as of 6 Jul 2026 (n=253). analytics_v2.json winrate_by_tier3.

Read: 42% of demos were sub-5-seat prospects that convert at roughly half the rate and account for most RED verdicts. Volume was partly manufactured by lowering the bar.

3. What actually converts (the strongest evidence in this pack)

Win-rate cut every way the data allows. The signals are unusually clean and they compound — the “ideal” demo is a Strong-BANT developer, 5+ seats, seen in person.

Cut	Best segment (win rate)	Worst segment
Quality verdict	GREEN 24.5%	AMBER 1.0% / RED 0%
BANT	Strong 27.9%	Partial/Weak/None ~0.6%
Account type	Developer 13.3%	Channel partner 7.5%
Demo mode	Onsite 15.2%	Online 9.1%
City	Hyderabad/Chennai 24–27%	Pune 0% / NCR 7%
Licence size	10+ seats 13.3%	Under 5 seats 6.5%

Source: analytics_v2.json (win-rate by verdict, bant_flag, dev/broker, onsite, main6 city, tier3), n=253 June demos.

Because GREEN/Strong-BANT predicts revenue almost perfectly, we built a calibrated probability model (top-quintile predicted 36.5% vs 34.0% actual). Its practical use: **the 98 demos scoring $\geq 5\%$ probability captured 96% of all wins — the other 155 demos produced one win between them.** The model is now wired into the hourly deal-audit skill so every deal gets a HOT/WARM/MID/COLD band.

Source: model_weights.json + score_deal.py; calibration on n=253. Threshold table in Presales_June_PostMortem.xlsx → Convert Model.

4. Revenue reality — closures, not demos

Revenue must be read on *deals that closed*, not demos that happened. June closures (42 deals) totalled **₹62.4L billed / ₹45.4L collected** — more than double the ₹29.4L attributable to June-demo wins, because large developer deals demoed months earlier close in June (e.g. Kaustubh/Gurgaon ₹8.2L, 30 seats, demoed April).

June closures by account type	Deals	Revenue	Avg demo → close
Developer	24	₹50.0L (80%)	~28 days
Channel partner	18	₹12.4L (20%)	~49 days

Source: Closures pipeline 5313 stage 35813, actualClosureDate Jun 2026 (n=42). closures_analytics.json. Velocity estimated from won-stage timestamp (exact close date not exposed by the connector).

Over the last six months, pre-sales closed **₹2.67 Cr across 208 deals**. Developers dominate both revenue and speed; the takeaway for both teams is that developer, 5+-seat accounts are where the money is — and they are under-fed at the top of the funnel.

5. Top of funnel — where leads come from and what converts

Lead source is captured on all 253 demos; UTM campaign / sub-source is captured on the paid ones (~43% of demos — Organic and WhatsApp correctly carry none). Channel ROI is stark:

Source	Demos	% 5+ seats	Won	Win rate	Read
Organic	95	58%	13	13.7%	Champion — highest volume & yield
Google	74	66%	7	9.5%	Best size mix; reliable paid lever
Facebook	47	51%	1	2.1%	19% of demos, 4% of wins — broken
WhatsApp (Interakt)	32	43%	3	9.4%	Decent inbound
Instagram	3	33%	0	0%	Negligible

Source: Kylas source field, per-source counts via search API (cfMeetingConductedOn Jun 2026, Pre-sales team). closures_analytics.json source_funnel.

Read: Facebook is burning ~1 in 5 demos for ~1 in 25 wins. Organic (SEO/brand/referral) is the cheapest, highest-intent source; Google is the best paid channel and brings the best size mix.

5.1 Which paid campaigns (UTM / sub-source)

Contrary to a common assumption, the paid demos *are* attributed — utmCampaign and subSource carry the campaign on the Google/Facebook leads (Organic simply has none). The paid demos concentrate in a few named campaigns:

Campaign cluster	Platform	June demos
Meta “Lead-Gen Conversion” (Apr-2024 + Jun-2025)	Facebook / Meta	~40
Google Search (search-jan24, -south, ai-calling)	Google	~32
Google Brand Search (+ -south)	Google	~23
Performance Max (traffic / retarget / competitor)	Google	~4
YouTube retarget	Google	1
No UTM — Organic / WhatsApp / direct	—	136

Source: Kylas report 361026 re-grouped by UTM Campaign and Sub Source, Last Month (created-in-June basis, n=237). Sub Source mirrors UTM Campaign.

Read: the biggest single paid cluster — Meta “Lead-Gen Conversion” (~40 demos) — is exactly the Facebook source that converts at 2.1%; the Google Search and (especially) Brand-Search campaigns are the better converters. So the paid re-allocation is concrete: move budget from the Meta lead-gen forms toward Google Brand/Search. Two data issues to fix: one live ad passes a broken “{{campaign.name}}” UTM, and several campaign names are stale (2024-dated campaigns still tagging 2026 leads), which blurs fresh-spend attribution.

6. Geography — rep cities vs off-territory

We have reps in six cities (Pune, Mumbai, Delhi/NCR, Bangalore, Chennai, Hyderabad). They convert ~2× better on average, and Hyderabad/Chennai are the best closers — but they are *starved* of demos, while Pune (HQ) converted 0% in June. Over six months, non-rep cities still produced ~₹77L (29% of revenue), and that is developer-led:

Off-territory (6-month closures)	Deals	Revenue
All non-rep cities	63	~₹77L (29% of total)
— of which Developers	38	~₹50L
— of which Channel partners	25	~₹27L

Source: closures6m/ (n=208 fetched of 216); city normalised from cfCity. Off-territory = cities outside the six rep cities.

Standout off-territory developer markets (6-month, by developer revenue): Kolkata (~₹9.5L; Amina/Doff 25 seats ₹4.44L), Jaipur (₹3.9L), Ranchi (₹3.5L; Kavita 25 seats), Bhubaneswar (₹4.3L; 15 seats), Coimbatore, Calicut (a 40-seat developer, ₹2.66L). These are real mid-market builders closing remotely with no local rep — an East-India developer belt in particular.

Nuance both teams must hold: for developers, territory barely matters (they close remotely); for brokers/channel partners it does (they need onsite hand-holding). So concentrate the *broker* motion in rep cities, and run *developer* demand-gen nationally.

7. Lead distribution & rep performance

Leads appear to be distributed by availability, not by rep strength — and the two reps have opposite strengths, so the current routing leaves conversion on the table.

Rep	Demos	Developer / CP mix	10+ seat deals	Overall win
Revati Ambike	135	37% / 62%	23	11.9%
Ashwini Nirmal	114	47% / 53%	6	7.9%

The crossover (the key point):

Win rate by segment	On Developers	On Channel partners
Revati Ambike	24.0%	4.8%
Ashwini Nirmal	3.7%	11.7%

Source: master_dataset.csv, creator × dev/broker × is_won (n=249 for the two reps). Source routing checked via per-source × creator counts — roughly proportional to volume, i.e. no strength-based routing.

Read: Revati is the developer closer (6× Ashwini on developers) and already handles almost all large deals; Ashwini is the channel-partner closer (2.4× Revati). Yet developers — 80% of revenue — are split ~50/50. Routing developers → Revati and channel partners → Ashwini should lift both segments. (June deals are still maturing, so absolute rates will rise; the relative pattern is the signal, strongest for Revati-on-developers with 12 wins.)

8. Open pipeline health & triage

Of 480 open pre-sales deals, 150 are genuinely workable (demo done, 5+ seats, active since mid-May). Scoring each on probability + a keep/churn call shows the open book is much thinner than it looks:

Conversion band	Deals	Churn call	Deals
HOT	16	KEEP (current sales)	76
WARM	16	REASSIGN → new sales	24
MID	26	BACK → pre-sales (re-qualify)	27
COLD	92	DISQUALIFY (close-lost)	23

Source: open_pipeline_focus.csv (n=150). Probability from the model; churn call from stage + notes + idle-days.

Only 32 deals (HOT+WARM, ~₹9.8L ACV) are worth chasing this week. Critically, ~1 in 3 of the “qualified” book (27 re-qualify + 23 disqualify) should never have reached sales as live pipeline — the dominant cause is a wrong/junior/unverified contact, a pre-sales qualification miss the audit already flags. A further 24 are real deals decaying on rep follow-up. Per-deal next actions and owners are in the accompanying workbook.

Source: Open_Pipeline_Focus.xlsx (WORK NOW, Reassign, Back-to-Pre-Sales, Disqualify sheets).

9. Systemic issues (fix once, benefit everywhere)

Why deals don’t move — the largest fixable cause sits upstream with qualification and data quality, not closing:

- **Root-cause of stalls:** Quality/ICP (60) and BANT-weak (18) together ≈ 31% of demos never had a chance; 63 stalls are pre-sales-owned vs 43 sales-owned. (Source: analytics_v2.json blocker + blocker_owner, n=253.)

- **Contact integrity:** 27 of 253 demos (11%) carried junk/placeholder names, and the dummy phone +919999999999 recurs; enrichment repeatedly resolves the deal phone to a different person. These pass into sales as “qualified.”
- **Attribution mostly works — two small gaps to close:** paid demos DO carry utmCampaign / subSource (~43% of demos; Organic correctly has none), so channel and campaign are measurable. The gaps are (a) one live ad passing a broken “{{campaign.name}}” UTM, and (b) stale campaign names (Apr-2024 / Jan-2024 campaigns still tagging Jun-2026 leads), which blur fresh-spend attribution. Note: the picklist ‘campaign’ field is unused — attribution lives in the UTM/sub-source fields, not there.
- **City field is messy:** cfCity contains misspellings (Banagalore, Guregaon, Ahemdabad) and states entered as cities (“Tamil Naidu”, “Andhra Pradesh”, “Odisha”), which corrupts any territory/routing logic. Switch to a validated dropdown.

10. Prioritised action plan

Owner key: M = Marketing, PS = Pre-Sales, S = Sales (shared manager to sequence). Each action lists the metric that proves it worked.

P0 — do this month (highest leverage)

1. **[PS] Gate every demo before it is booked.** Require verified company + real phone (auto-reject 9999999999 / single-word names), a named decision-maker, BANT $\geq$ Partial, and 5+ seats. Run deal-audit before the demo. Metric: RED demos $<10\%$; junk-name demos ~ 0 .
2. **[M] Re-aim ad spend to what converts.** Scale Google, invest in Organic (SEO/brand/content); fix Facebook targeting to developer/large-account lookalikes or move its budget to Google; drop Instagram. Metric: blended demo $\rightarrow$ win $\geq 12\%$; Facebook win-rate $\geq 8\%$ or spend reallocated.
3. **[M+PS] Bias the whole funnel to developers & 5+ seats.** Developers are 80% of revenue. Set a developer-share floor ($\geq 50\%$ of demos) and a 5-seat minimum. Metric: 5+ seat demos ≥ 200 /month; developer share $\geq 50\%$.
4. **[PS/S] Route by strength.** Send developer leads to Revati, channel-partner leads to Ashwini. Metric: developer win-rate on the developer-closer maintained $\geq 20\%$.

P1 — next 30–60 days

1. **[M] Run a remote developer desk for tier-2 / off-territory.** Prioritise the East belt (Kolkata, Ranchi, Bhubaneswar, Siliguri), Gujarat and tier-2 South. Metric: off-territory developer revenue $\geq$ current ₹50L/6-mo run-rate, tracked monthly.
2. **[M] Tighten attribution and act on it.** Fix the broken “{{campaign.name}}” UTM and refresh stale campaign names so fresh spend is readable; then reallocate from the Meta “Lead-Gen Conversion” cluster (biggest paid volume, weakest conversion) toward Google Brand/Search. Metric: 100% of paid deals carry a clean campaign; Meta lead-gen win-rate $\geq 8\%$ or budget moved.
3. **[PS] Concentrate the broker motion in rep cities & fix Pune.** Push demand into Hyderabad/Chennai (best closers); root-cause Pune (0% in June). Metric: Hyderabad+Chennai demo volume up; Pune win-rate $>0\%$.
4. **[S] Sales-hygiene SLA + auto-reassign.** Any HOT/WARM deal idle >21 days escalates/reassigns. Metric: recover the $\sim$ ₹4.5L currently stalled on reps; median idle on HOT/WARM <14 days.

P2 — structural / ongoing

1. **[M] Force onsite for HOT deals in rep cities,** especially Hyderabad/Chennai/NCR where onsite is $<15\%$ today (onsite $\approx 3\times$ revenue per demo). Metric: $\geq 40\%$ of Main-6 demos in person.
2. **[PS] Grow Organic with competitor-comparison content** (vs Zoho, Leadrat, Buildesk, Kit19) and developer case studies. Metric: Organic demo volume and win-rate trend up.
3. **[M/PS] Stand up a named-account enterprise lane** (40+ seat developers, CXO multi-threading). Metric: ≥ 15 enterprise (40+) demos/month vs ~ 5 .
4. **[Ops] Clean the data.** Validated cfCity dropdown; keep the conversion model re-fitted monthly (it's already in the deal-audit CRON). Metric: zero states-as-cities; band stamped on every new deal.

Appendix — data sources & artifacts

Every figure in this report is reproducible from these, all stored in the `presales_june_analysis` folder:

- `master_dataset.csv` — 253 June demos, per-deal fields + verdict + BANT + probability.
- `closures_dataset.csv` / `closures_analytics.json` — 42 June closures (revenue, velocity, source funnel).
- `closures6m/` — 208 of 216 six-month closures (city, type, billed) for the geography analysis.
- `open_pipeline_focus.csv` + `Open_Pipeline_Focus.xlsx` — 150 open deals: probability, next action, churn call.
- `Presales_June_PostMortem.xlsx` — 14 sheets: What Converts, City Deep-Dive, Marketing Source, Convert Model, Revenue (Closures), etc.
- `model_weights.json` + `score_deal.py` — the conversion model, now embedded in the deal-audit skill.

Reproduce the counts in Kylas: Pre-sales team = report 361026 filter; demos = cfMeetingConductedOn in period; closures = pipeline 5313 / stage 35813 / actualClosureDate in period; open = forecastingType OPEN + pipeline 5313.
